Trip Report for ferrous actals actes then to the Soviet Union May 17 - May 31, 1975

Andrew Paretti, Head of Delegation Office of Later Program Operations WH-447

Flexbook Green, Associate Administrator for International Activities 4-100

John T. Chatt. Deputy Assistant Administrator for mater Program operations un-440

James L. Ague. Assistant Administrator for water and hozardous Materials Williams

baser the Environmental Agreement between the Cotted States and the Saviet Union, a great of specialists more the quests of the cinistry of Formals Metallurgy of the Saviet Union from Eay 17 through May 31, 1975, to review and tour the maste water treatment facilities of the Saviet Iron and Steel Indestry (Project II - 2.2 - Prevention of Mater Felliation from Industrial Sources, Sub-project (6) - Iron and Steel).

Leviroscental cetants and technological exchange between the two countries is very tech alive as regards wasce ester. This observation is case at this time to counter suggestions that have been voiced recently as to the future of the agreement. If the four industrial sub-projects, this one covering the Iros and beest industry is the only one upere the levist rates will have become first. They showed the same initiative that we feel we excitated when nosting sub-projects a and a first on Pulphand Paper and Chemical Technology industries responsive to our detailed questions at their plant visitations and very responsive to our detailed questions at their hassaurch and veston institutes.

A detailed report is attached. It is the thinking of the three industry specialists and typelf. We not for a few hours on our last train rice from thereof to concer and had a final meeting on the rather flight name. One can was assigned to actually propare the report subject to concurrence of the remainder of the delegation. I find talk the best meetined to arrive at a meaningful survey of the technical aspects.

It should be pointed out that the United States appears to be absed in waste water treateaut as regards the from and Steel industry. They only seen to concentrate on recovery suspended waterials and on this facet they are doing a fine job. Incir chemical/biological createant to date such negligible. Though the worn not involved with air pollution, it was oblived that they are not yet serious. The scake exitting from the stacks of the Iron and Stock cills and in lact cost industries we passed by in our travels is quite obvious. I could have to essue that their five year plans have not yet focused on this problem in a meaningful may.

It is also evident that they are interested in a continuing exchange with the Iron and Steel Industry based on Appendix I which is also an attachment to this report. This very detailed appendix was what they desired in the protocol. He could not sign such a protocol without time to properly review it and they understood our position. I enclose it to show the depth of their feeling on the continuing exchange. The protocol me did agree on is also attached, along with the list of Mater Purification problems that the toviets are concerned with. He will attach to adequately cover these when we heat the "inistry of Ferrous Secallurgy in the United States this coming September.

It is apparent that we should share our technology on pollution concrol with the Soviet Union. Our pollution regulations are becoming very stringent and with this stringency there are substantial costs involved to improve the air and water exissions. Our steel lodgetry has never been overly successful in competing with foreign steel canufacturers. It is existential that pollution control will also increase the cost of their products and enable our industry a chance to butter compete with some of the world earsets.

As sentioned in a previous report, they are notching our coursesy and extend thouselves to the extreme for the conforts of the delegation. Each (dinistry is an independent body and other than for a few preakfasts and a discullaneous lunch or dinner, we were bosted at every seal by our escorts or our hosts at an institute or steel will. They insisted en paying the everweight charges of two members of the delegation which came to almost \$150.00. This ministry also essigned three escorts to - accompany us at all times. Typical of our other trips to the Saviet build they put great stress on cultural tours of every city we visited. All of their statues primarily revolve around some facet of their communist/socialist form of gavernment or their victory over termeny in norld her II. Their apparent oride to their form of government todes through to a forceful samer. They seem to concentrate on selling this point with on ter reciprocal toers in the united States, the benefits of our free enterprise system are reactly apparent with no lecturing involved. Every J. S. delegate that has made a Soviet tour with us immediately comments on the consumer advantages in the United States. It is beyond comparison with their system.

can the subject of protecol, it is edvices now that each sinistry wants a protocol or necessaries on all sections. It is importable that we have a called States interpreter on the subjections in the factor for this purpose as well as for everall assistance to the delegation accusers.

Attachment do. 1 - Report of Trio to USSA

Attachment he. 2 - Acpendix 1

Attachment No. 3 - Signed Protectl
